Quality Assurance (QA) sub-module to our ShopFloor for MS Dynamics NAV

The easy and paperless shop floor quality reporting system – use existing or create new procedures easily

Quality Reporting in MS Dynamics NAV Makes Your Company More Effective

With this sub-module to our ShopFloor you can create your own quality reporting system or implement your already existing procedures into MS Dynamics NAV. Tolerances, measurements and other relevant parameters can, on your decision, be reported by the operators, wherever in the process you need it. Current and historic data will help you provide your customers with certificates, but also facilitate analysis of internal performance.

Features and Main Functionalities

- Reporting of chosen parameters whenever you want it
- The ability to setup a demand for quality reporting before the operators can close a job
- In conjunction with NAVEKSA BSL module, you can create certificates with relevant track numbers
- Paperless reporting ensures readable and uniformed outputs
- All data and transactions are stored. This data can be utilised for internal analysis and optimisation

Compatible with current versions of NAVEKSA ShopFloor for MS Dynamics NAV

This module can be implemented in few hours (plug and play). The module does not make any changes to a standard MS Dynamics NAV solution.
